1. Introduction

1.1. Purpose

This design document will create both a high-level overview of our project – Human-autonomous teamwork of ground and air vehicles – architecture. The goal of the project is to allow for continuous compositional control between human operators and autonomous vehicles. This includes allowing one operator to take control over multiple different vehicles/robots.

1.2. Scope

- Support direct robot control
- Support switching between robots quickly
- Allow for operators to get a “birds eye” view of the situation

2. System Overview

2.1. Users

- **Mission operators:** Responsible for monitoring all autonomous vehicles and assisting them to complete their tasks.
- **Field operatives:** Check for updates on mission status and directives.

2.2. Key Features

- **Different control modes:** Support different control schemes: tanks, cars, drones, etc.
- **Top level view:** Allow operatives to see all active robots and their status.
- **Robot map:** Utilizing GPS data or SLAM tracking, display a map of robot location.
- **Robot-robot communication:** Autonomous agents should be able to communicate with each other, requesting help when they are not suited for specific tasks.
- **Focus view:** Allow operators to pin multiple robots to their screen.
- **Non-local access:** The control panel should be accessible from external networks to account for users on cellular devices.

3. System Architecture

3.1. High-Level Architecture

- **Frontend:** HTMX for HTML management and TailwindCSS for styling
- **Backend:** Python server running as a ROS2 node.
- **Database:** PostgreSQL or MongoDB

3.2. System flow

3.2.1. Setup

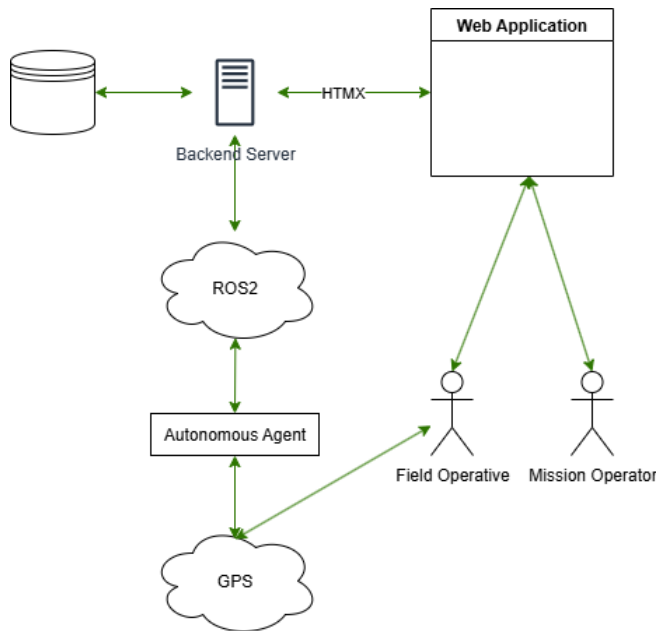

- Server initialized
- Establish connection with database
- Autonomous agents discovered through ROS2

3.2.2. User

- User logs in to the frontend
- Presented with array of all agents and map
- Select an agent to view, control scheme displayed
- Optionally, pin additional agent views

4. Diagrams

4.1. App Structure

4.2. Frontend Design

4.2.1. Auth View

Username

Password

Login

4.2.2. Agent List View

Agent 1

Agent 2

Agent 3

Agent 4

Map of agents

4.2.3. Agent View

Agent 1	Status Information
Webcam	
Enter - Toggle Control W - Forward S - Backward A - Turn Left D - Turn Right	

4.2.4. Multi Agent View

Agent 1 - Active	Agent 2
Webcam	Webcam
Enter - Toggle Control W - Forward S - Backward A - Turn Left D - Turn Right	Enter - Toggle Control W - Forward S - Backward A - Strafe Left D - Strafe Right Q - Turn Left E - Turn Right

4.2.5. Multi Agent View cont.

Agent 1 - Active	Agent 2
Enter - Toggle Control W - Forward S - Backward A - Turn Left D - Turn Right <div>Webcam</div>	Enter - Toggle Control W - Forward S - Backward A - Strafe Left D - Strafe Right Q - Turn Left E - Turn Right <div>Webcam</div>
Agent 3	Agent 4
Enter - Toggle Control W - Forward S - Backward A - Turn Left D - Turn Right <div>Webcam</div>	Enter - Toggle Control W - Forward S - Backward A - Turn Left D - Turn Right <div>Webcam</div>

4.2.6. Agent Notifications

<div>Agent 1 requests assistance</div> <div>X</div>	<div>Field operative requires assistance</div> <div>X</div>
<div>Agent 1 has identified target</div> <div>X</div>	<div>Agent 2 navigating to Agent 1</div> <div>X</div>

5. Classes

5.1. Agent

Contains the capabilities of a given agent, as well as its ROS2 information.

- node: str
- namespace: str
- capabilities: set[Capabilities]

5.2. Capability

Represents behaviours/functions the robot has access too

- kind: str

5.3. Example Capability: Move

Represents the robot's ability to move.

- kind: str = "move"
- move(linear: tuple[float, float, float], angular: [float, float, float])
 - "linear" represents the linear velocity
 - "angular" represents the angular velocity

5.4. Example Capability: Location

Represents the robot's ability to have a global location

- kind: str = "location"
- get_location()

5.5. Example Capability: Vision

Represents the robot's ability to see

- kind: str = "vision"
- get_image()
 - Get the current frame from the robot.

5.6. User

Represents a user of the application.

- role: "operator" | "operative"
 - Important for preventing general operatives from interfering with operators.
- username: str
- static login(username: str, password: str)
